

Appendix D MATLAB algorithms

Appendix Outline

- D.1** Introduction
- D.2** Algorithm 1.1: numerical integration of a system of first order differential equations by choice of Runge-Kutta methods RK1, RK2, RK3 or RK4
- D.3** Algorithm 1.2: numerical integration of a system of first order differential equations by Heun's predictor-corrector method.
- D.4** Algorithm 1.3: numerical integration of a system of first order differential equations by the Runge-Kutta-Fehlberg 4(5) method with adaptive step size control.
- D.5** Algorithm 2.1: numerical solution for the motion of two bodies relative to an inertial frame.
- D.6** Algorithm 2.2: numerical solution for the motion m_2 of relative to m_1 .
- D.7** Calculation of the Lagrange coefficients f and g and their time derivatives in terms of change in true anomaly.
- D.8** Algorithm 2.3: calculation of the state vector given the initial state vector and the change in true anomaly.
- D.9** Algorithm 2.4: find the root of a function using the bisection method.
- D.10** MATLAB solution of Example 2.18
- D.11** Algorithm 3.1: solution of Kepler's equation by Newton's method
- D.12** Algorithm 3.2: solution of Kepler's equation for the hyperbola using Newton's method
- D.13** Calculation of the Stumpff functions $S(z)$ and $C(z)$
- D.14** Algorithm 3.3: solution of the universal Kepler's equation using Newton's method
- D.15** Calculation of the Lagrange coefficients f and g and their time derivatives in terms of change in universal anomaly
- D.16** Algorithm 3.4: calculation of the state vector given the initial state vector and the time lapse Δt
- D.17** Algorithm 4.1: obtain right ascension and declination from the position vector

- D.18 Algorithm 4.2: calculation of the orbital elements from the state vector
- D.19 Calculation of $\tan^{-1}(y/x)$ to lie in the range 0 to 360°.
- D.20 Algorithm 4.3: obtain the classical Euler angle sequence from a DCM.
- D.21 Algorithm 4.4: obtain the yaw, pitch and roll angles from a DCM.
- D.22 Algorithm 4.5: calculation of the state vector from the orbital elements
- D.23 Algorithm 4.6: calculate the ground track of a satellite from its orbital elements.
- D.24 Algorithm 5.1: Gibbs method of preliminary orbit determination
- D.25 Algorithm 5.2: solution of Lambert's problem
- D.26 Calculation of Julian day number at 0 hr UT
- D.27 Algorithm 5.3: calculation of local sidereal time
- D.28 Algorithm 5.4: calculation of the state vector from measurements of range, angular position and their rates
- D.29 Algorithms 5.5 and 5.6: Gauss method of preliminary orbit determination with iterative improvement
- D.30 Calculate the state vector at the end of a finite-time, constant thrust delta-v maneuver.
- D.31 Algorithm 7.1: Find the position, velocity and acceleration of B relative to A 's co-moving frame.
- D.32 Plot the position of one spacecraft relative to another.
- D.33 Solve the linearized equations of relative motion of a chaser relative to a target whose orbit is an ellipse.
- D.34 Convert the numerical designation of a month or a planet into its name
- D.35 Algorithm 8.1: calculation of the state vector of a planet at a given epoch
- D.36 Algorithm 8.2: calculation of the spacecraft trajectory from planet 1 to planet 2
- D.37 Algorithm 9.1: Calculate the direction cosine matrix from the quaternion
- D.38 Algorithm 9.2: Calculate the quaternion from the direction cosine matrix.
- D.39 Solution of the spinning top problem (Example 9.21)
- D.40 Calculation of a gravity-turn trajectory.

D.1 Introduction

This appendix lists MATLAB scripts which implement all of the numbered algorithms presented throughout the text. The programs use only the most basic features of MATLAB and are liberally commented so as to make reading the code as easy as possible. To “drive” the various algorithms, one can use MATLAB to create graphical user interfaces (GUIs). However, in the interest of simplicity and keeping our focus on the algorithms rather than elegant programming techniques, GUIs were not developed. Furthermore, the scripts do not use files to import and export data. Data is defined in declaration statements within the scripts. All output is to the screen, that is, to the MATLAB command window. It is hoped that interested students will embellish these simple scripts or use them as a springboard towards generating their own programs.

Each algorithm is illustrated by a MATLAB coding of a related example problem in the text. The actual output of each of these examples is also listed.

It would be helpful to have MATLAB documentation at hand. There are a number of practical references on the subject, including Hahn (2002), Kermit and Davis (2002) and Magrab (2000). MATLAB documentation may also be found at The MathWorks web site (www.mathworks.com). Should it be necessary to do so, it is a fairly simple matter to translate these programs into other software languages.

These programs are presented solely as an alternative to carrying out otherwise lengthy hand computations and are intended for academic use only. They are all based exclusively on the introductory material presented in this text and therefore do not include the effects of perturbations of any kind.

D.2 Algorithm 1.1: numerical integration by Runge-Kutta methods RK1, RK2, RK3 or RK4.

Function file rkf1_4.m

```

% ~~~~~
function [tout, yout] = rk1_4(ode_function, tspan, y0, h, rk)
% ~~~~~
%{
    This function uses a selected Runge-Kutta procedure to integrate
    a system of first-order differential equations  $dy/dt = f(t,y)$ .

    y          - column vector of solutions
    f          - column vector of the derivatives  $dy/dt$ 
    t          - time
    rk         - = 1 for RK1; = 2 for RK2; = 3 for RK3; = 4 for RK4
    n_stages   - the number of points within a time interval that
                  the derivatives are to be computed
    a          - coefficients for locating the solution points within
                  each time interval
    b          - coefficients for computing the derivatives at each
                  interior point
    c          - coefficients for the computing solution at the end of
                  the time step
    ode_function - handle for user M-function in which the derivatives f
                  are computed
    tspan      - the vector [t0 tf] giving the time interval for the
                  solution
    t0         - initial time
    tf         - final time
    y0         - column vector of initial values of the vector y
    tout       - column vector of times at which y was evaluated
    yout       - a matrix, each row of which contains the components of y
                  evaluated at the corresponding time in tout
    h          - time step
    ti         - time at the beginning of a time step
    yi         - values of y at the beginning of a time step
    t_inner    - time within a given time step
    y_inner    - values of y within a given time step

    User M-function required: ode_function
%}

function Example_2_18
% ~~~~~
%{
    This program uses the Runge-Kutta-Fehlberg 4(5) method to solve the
    earth-moon restricted three-body problem (Equations 2.192a and 2.192b)
    for the trajectory of a spacecraft having the initial conditions
    specified in Example 2.18.

    The numerical integration is done in the external function 'rkf45',
    which uses the subfunction 'rates' herein to compute the derivatives.

    days      - converts days to seconds
    G          - universal gravitational constant (km^3/kg/s^2)
    rmoon      - radius of the moon (km)
    rearth     - radius of the earth (km)
    r12        - distance from center of earth to center of moon (km)
    m1,m2      - masses of the earth and of the moon, respectively (kg)
    M          - total mass of the restricted 3-body system (kg)
    mu         - gravitational parameter of earth-moon system (km^3/s^2)
    mu1,mu2    - gravitational parameters of the earth and of the moon,
                respectively (km^3/s^2)
    pi_1,pi_2  - ratios of the earth mass and the moon mass, respectively,
                to the total earth-moon mass
    W          - angular velocity of moon around the earth (rad/s)
    x1,x2      - x-coordinates of the earth and of the moon, respectively,
                relative to the earth-moon barycenter (km)
    d0         - initial altitude of spacecraft (km)
    phi        - polar azimuth coordinate (degrees) of the spacecraft
                measured positive counterclockwise from the earth-moon line
    v0         - initial speed of spacecraft relative to rotating earth-moon
                system (km/s)
    gamma      - initial flight path angle (degrees)
    r0         - initial radial distance of spacecraft from the earth (km)
    x,y        - x and y coordinates of spacecraft in rotating earth-moon
                system (km)
    vx,vy      - x and y components of spacecraft velocity relative to
                rotating earth-moon system (km/s)
    f0         - column vector containing the initial values of x, y, vx and vy
    t0,tf      - initial time and final times (s)
    t          - column vector of times at which the solution was computed
    f          - a matrix whose columns are:
                column 1: solution for x at the times in t
                column 2: solution for y at the times in t
                column 3: solution for vx at the times in t
                column 4: solution for vy at the times in t
    xf,yf      - x and y coordinates of spacecraft in rotating earth-moon
                system at tf
    vxf, vyf   - x and y components of spacecraft velocity relative to
                rotating earth-moon system at tf
    df         - distance from surface of the moon at tf

D.29 Algorithms 5.5 and 5.6: Gauss method of preliminary orbit determination with iterative improvement

Function file `gauss.m`

```

% ~~~~~
function [r, v, r_old, v_old] = ...
    gauss(Rho1, Rho2, Rho3, R1, R2, R3, t1, t2, t3)
% ~~~~~
%{
    This function uses the Gauss method with iterative improvement
    (Algorithms 5.5 and 5.6) to calculate the state vector of an
    orbiting body from angles-only observations at three
    closely-spaced times.

    mu            - the gravitational parameter (km^3/s^2)
    t1, t2, t3    - the times of the observations (s)
    tau, tau1, tau3 - time intervals between observations (s)
    R1, R2, R3    - the observation site position vectors
                  at t1, t2, t3 (km)
    Rho1, Rho2, Rho3 - the direction cosine vectors of the
                  satellite at t1, t2, t3
    p1, p2, p3    - cross products among the three direction
                  cosine vectors
    Do            - scalar triple product of Rho1, Rho2 and Rho3
    D             - Matrix of the nine scalar triple products
                  of R1, R2 and R3 with p1, p2 and p3
    E            - dot product of R2 and Rho2
    A, B         - constants in the expression relating slant range
                  to geocentric radius
    a,b,c        - coefficients of the 8th order polynomial
                  in the estimated geocentric radius x
    x            - positive root of the 8th order polynomial
    rho1, rho2, rho3 - the slant ranges at t1, t2, t3
    r1, r2, r3    - the position vectors at t1, t2, t3 (km)
    r_old, v_old  - the estimated state vector at the end of
                  Algorithm 5.5 (km, km/s)
    rho1_old,
    rho2_old, and
    rho3_old      - the values of the slant ranges at t1, t2, t3
                  at the beginning of iterative improvement
                  (Algorithm 5.6) (km)
    diff1, diff2,
    and diff3     - the magnitudes of the differences between the
                  old and new slant ranges at the end of
                  each iteration
    tol          - the error tolerance determining
                  convergence
    n            - number of passes through the
                  iterative improvement loop
    nmax         - limit on the number of iterations
    ro, vo       - magnitude of the position and
                  velocity vectors (km, km/s)
    vro         - radial velocity component (km)
    a            - reciprocal of the semimajor axis (1/km)
    v2          - computed velocity at time t2 (km/s)
%}

```

```

r, v          - the state vector at the end of Algorithm 5.6
                (km, km/s)

D.30 Calculate the state vector after a finite-time, constant thrust delta-v maneuver

Function file `integrate_thrust.m`

```

% ~~~~~~
function integrate_thrust
% ~~~~~~
%{
  This function uses rkf45 to numerically integrate Equation 6.26 during
  the delta-v burn and then find the apogee of the post-burn orbit.

  The input data are for the first part of Example 6.15.

  mu          - gravitational parameter (km^3/s^2)
  RE          - earth radius (km)
  g0          - sea-level acceleration of gravity (m/s^2)
  T           - rated thrust of rocket engine (kN)
  Isp         - specific impulse of rocket engine (s)
  m0         - initial spacecraft mass (kg)
  r0         - initial position vector (km)
  v0         - initial velocity vector (km/s)
  t0         - initial time (s)
  t_burn      - rocket motor burn time (s)
  y0         - column vector containing r0, v0 and m0
  t          - column vector of the times at which the solution is found (s)
  y          - a matrix whose elements are:
               columns 1, 2 and 3:
                 The solution for the x, y and z components of the
                 position vector r at the times t
%}

```

```

        columns 4, 5 and 6:
            The solution for the x, y and z components of the
            velocity vector v at the times t
        column 7:
            The spacecraft mass m at the times t
r1      - position vector after the burn (km)
v1      - velocity vector after the burn (km/s)
m1      - mass after the burn (kg)
coe     - orbital elements of the post-burn trajectory
          (h e RA incl w TA a)
ra      - position vector at apogee (km)
va      - velocity vector at apogee (km)
rmax    - apogee radius (km)

Solution of the spinning top problem**Function file** Example_9_23.m

```

%~~~~~
function Example_9_23
% ~~~~~
%{
    This program numerically integrates Euler's equations of motion
    for the spinning top (Example 9.23, Equations (a)). The
    quaternion is used to obtain the time history of the top's
    orientation. See Figure 9.26.
